Daksh Game BaaS — Product Prioritization & MVP

Mathematical RICE Simulation & Definitive "Where to Begin" Execution Blueprint

INTERNAL STRATEGY

Framework: RICE (Reach, Impact, Conf, Effort)
Date: October 2026 | **Version:** 1.0

🎯 Executive Verdict: Where to Begin (Day 1 / Sprint 1 MVP)

As an unfunded game backend platform, Daksh **cannot boil the ocean**. We must begin with the **"Zero-Dollar Indie Velocity Loop"**: (1) `npx daksh dev` local-first CLI, (2) Unity C# SDK, (3) PlayFab Economy V2 Parity, (4) AI Command Menu (`Cmd`+K), and (5) The Famous Eject Button. This delivers an immediate, functional game backend on a developer's laptop with **$0 cloud hosting costs** and **zero vendor lock-in**.

1. THE RICE PRIORITIZATION FRAMEWORK

SCORE = (R × I × C) ÷ E

Reach (R: 0-100)
% of prospective game studios using this feature during their first 90 days.

Impact (I: 0.25-3.0)
3.0 = Massive (Game Changer)
2.0 = High | 1.0 = Medium

Confidence (C: 0.5-1.0)
1.0 = High (reusing Nakama core)
0.8 = Med | 0.5 = High Risk

Effort (E: Weeks)
Person-weeks for 2 senior engineers to ship production-ready code.

2. COMPREHENSIVE RICE SCORING SIMULATION (15 CANDIDATE FEATURES)

RANK	FEATURE NAME & SCOPE	REACH	IMPACT	CONF.	EFFORT	RICE SCORE	MILESTONE
#1	**Local-First CLI (`npx daksh dev`)** — 1-cmd Docker Nakama/Postgres	100	3.0	1.0	2.0 wks	**150.0**	Sprint 1 (MVP)
#2	**Unity C# SDK (`com.daksh.sdk`)** — UPM package & bootstrap	95	3.0	1.0	2.5 wks	**114.0**	Sprint 1 (MVP)
#3	**PlayFab Economy V2** — Currencies, Catalogs, Stores, Wallets	90	3.0	1.0	3.0 wks	**90.0**	Sprint 1 (MVP)
#4	**AI Command Menu (`Cmd`+K) & MCP** — Natural language recipes	85	3.0	0.8	2.5 wks	**81.6**	Sprint 1 (MVP)
#5	**The Famous Eject Button** — 1-click Helm + Postgres dump export	80	2.0	1.0	2.0 wks	**80.0**	Sprint 1 (MVP)
#6	**Player Auth Federation** — Device ID, Steam, Google Play, Apple	90	2.0	1.0	2.5 wks	**72.0**	Sprint 1 (MVP)
#7	Turn-Based Multiplayer Engine — Async & sync card/board room state	70	2.0	1.0	2.0 wks	**70.0**	Sprint 2
#8	Leaderboards & Real-Time Stats — Tiered rankings & seasonal reset	80	1.0	1.0	1.5 wks	**53.3**	Sprint 2
#9	Real-Time Relay Server — Client-authoritative UDP/WebSocket netcode	65	2.0	0.8	2.5 wks	**41.6**	Sprint 2
#10	Matchmaking Rulesets & Flexing — AccelByte parity latency relaxation	50	2.0	0.8	2.5 wks	**32.0**	Sprint 2
#11	LiveOps Player Segments & Remote Config — Dynamic game tuning	60	1.0	1.0	2.0 wks	**30.0**	Sprint 2
#12	Matchmaking X-Ray Admin Portal — Live session inspection & trace	45	2.0	0.8	2.5 wks	**28.8**	Sprint 2
#13	Agones Dedicated Server (DGS) — Linux binary orchestration on K8s	30	3.0	0.8	4.0 wks	**18.0**	Sprint 3
#14	Managed Multi-Region Cloud Hosting — Anycast 5 Super-Regions	40	3.0	0.5	6.0 wks	**10.0**	Sprint 3
#15	ClickHouse OLAP Telemetry Engine — High-volume analytics ingestion	35	2.0	0.8	6.0 wks	**9.3**	Sprint 3

3. WHY THE TOP RANKED MVP FEATURES WIN

1. Local-First CLI (`npx daksh dev`) — Score: 150.0

Strategic Moat: Solves the #1 complaint against PlayFab: offline friction. Developers boot Nakama + Postgres + Daksh UI in <60s on an airplane with zero accounts or internet access.

2. Unity C# SDK (`com.daksh.sdk`) — Score: 114.0

Adoption Driver: 70%+ of target indie games run on Unity. Wrapping Nakama's C# client gives instantaneous UPM installation, Device ID auth, and automatic offline retry queues.

3. PlayFab Economy V2 Parity — Score: 90.0

Revenue Core: Games must monetize. Delivers dual-currency wallets (Gold/Gems), item catalogs, and bundle drop tables with 100% PlayFab migration compatibility.

4. AI Command Menu (`Cmd+K`) — Score: 81.6

Pioneer Differentiator: Kills 14-step manual form filling. Typing *"Add 3 tiers of swords and a starter pack"* generates the complete catalog instantly. Drives organic Twitter/TikTok virality.

4. PHASED ENGINEERING SPRINT ROADMAP

SPRINT 1 WEEKS 1–4	**The Core Indie MVP:** Deliver `npx daksh dev`, Unity UPM package, Economy V2 (Currencies/Catalog), AI Command Menu (`Cmd+K`), Device Auth, and The Famous Eject Button. Complete local test on air-gapped laptop.
SPRINT 2 WEEKS 5–8	**Multiplayer & Netcode Suite:** Turn-Based Engine (Async/Sync chess/cards), Real-Time Relay Netcode (WebSocket/UDP), Leaderboards, and AccelByte-grade Matchmaking Rulesets with Matchmaking X-Ray portal.
SPRINT 3 WEEKS 9–12	**Paid Cloud & Global Scale:** Anycast Edge routing across 5 Super-Regions (NA, EU, AP, LATAM, MEA), Agones Dedicated Game Server orchestration on Kubernetes, Stripe SaaS billing, and ClickHouse OLAP ingestion.

5. STRATEGIC ROI COMPARISON & DEFINITION OF DONE

STRATEGIC DIMENSION	NAIVE APPROACH (CLOUD HOSTING FIRST)	DAKSH RICE STRATEGY (LOCAL-FIRST MVP)
Infrastructure Capital	$50,000+ (Multi-region K8s, Anycast IPs, AWS egress)	**$0.00** (Runs on developer laptops)
Time to First User	6 to 9 months	**4 weeks**
Sales Friction	High (Requires credit cards & security reviews)	**Zero** (1-line open-source CLI install)
Definition of Done	**Sprint 1 Success Metric:** A game developer on macOS, Linux, or Windows WSL installs Daksh with `npx daksh dev`, connects a Unity game via Device ID, buys an item from the AI-generated catalog, and exports a standalone Helm chart in <5 minutes with WiFi disabled.
